

# Quick Start Guide

# **Unidrive M200/201**

Frame sizes 1 to 4

Flexible machine integration through communications

Part Number: 0478-0038-07

Issue: 7

Control Techniques<sup>11</sup> Leroy-Somer<sup>12</sup>

### **Original Instructions**

For the purposes of compliance with the EU Machinery Directive 2006/42/EC

This guide is intended to provide basic information required in order to set-up a drive to run a motor. For more detailed installation information, please refer to the relevant drive documentation which is available to download from:

www.drive-setup.com

#### Warnings, Cautions and Notes

A Warning contains information which is essential for avoiding a safety hazard.

A Caution contains information which is necessary for avoiding a risk of damage to the product or other equipment.

NOTE

A **Note** contains information, which helps to ensure correct operation of the product.

This guide does not include safety information. Incorrect installation or operation of the drive, could cause personnel injury or equipment damage. For essential safety information, please refer to the relevant drive documentation or the safety booklet supplied with the drive.

# **EU Declaration of Conformity**

Control Techniques Ltd Moteurs Leroy-Somer
The Gro Usine des Agriers

Newtown Boulevard Marcellin Leroy

Powys CS10015

UK 16915 Angoulême Cedex 9

SY16 3BE France

This declaration is issued under the sole responsibility of the manufacturer. The object of the declaration is in conformity with the relevant Union harmonization legislation. The declaration applies to the variable speed drive products shown below:

| Model number | Interpretation | Nomenclature aaaa - bbc ddddde  |
|--------------|----------------|---|
| аааа         | Basic series   | M100, M101, M200, M201, M300, M400, M600, M700, M701, M702, F300, H300, E200,E300, HS30, HS70, HS71, HS72, M000, RECT                                   |
| bb           | Frame size     | 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11  |
| С            | Voltage rating | 1 = 100 V, 2 = 200 V, 4 = 400 V, 5 = 575 V, 6 = 690 V   |
| ddddd        | Current rating | Example 01000 = 100 A   |
| е            | Drive format   | A = 6P Rectifier + Inverter (internal choke), D = Inverter, E = 6P Rectifier + Inverter (external choke), T = 12P Rectifier + Inverter (external choke) |

The model number may be followed by additional characters that do not affect the ratings. The variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonized standards:

| EN 61800-5-1:2007           | Adjustable speed electrical power drive systems - Part 5-1:<br>Safety requirements - Electrical, thermal and energy   |
|-----------------------------|---|
| EN 61800-3: 2004+A1:2012    | Adjustable speed electrical power drive systems - Part 3: EMC requirements and specific test methods  |
| EN 61000-6-2:2005           | Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments  |
| EN 61000-6-4: 2007+ A1:2011 | Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments   |
| EN 61000-3-2:2014           | Electromagnetic compatibility (EMC) - Part 3-2: Limits for harmonic current emissions (equipment input current ≤16 A per phase)   |
| EN 61000-3-3:2013           | Electromagnetic compatibility (EMC) - Part 3-3: Limitation of voltage changes, voltage fluctuations and flicker in public, low voltage supply systems, for equipment with rated current ≤16 A per phase and not subject to conditional connection |

EN 61000-3-2:2014 Applicable where input current < 16 A. No limits apply for professional equipment where input power ≥1 kW.

These products comply with the Restriction of Hazardous Substances Directive (2011/65/EU), the Low Voltage Directive (2014/35/EU) and the Electromagnetic Compatibility Directive (2014/30/EU).

**G Williams** 

Vice President, Technology

Date: 17th March 2016

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters.

The drives must be installed only by professional installers who are familiar with requirements for safety and EMC. Refer to the Product Documentation. An EMC data sheet is available giving detailed information. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used.

### 3 Mechanical installation

The drives can be panel mounted with 0 mm space between the drives. For further information on mechanical installation refer to the *Power Installation Guide*.

To remove the terminal cover, use a flat bladed screwdriver to rotate the terminal cover locating clip by approximately 30° in a counter clockwise direction, and then slide the cover down.

| Drive |     | Н     | '   | N    |     | D    | ı   | M1    | N    | 12   | !  | Ø    | ,  | 4    | Е   | <b>3</b> * |
|-------|-----|-------|-----|------|-----|------|-----|-------|------|------|----|------|----|------|-----|------------|
| Size  | mm  | in    | mm  | in   | mm  | in   | mm  | in    | mm   | in   | mm | in   | mm | in   | mm  | in         |
| 1     | 160 | 6.30  | 75  | 2.95 | 130 | 5.12 | 143 | 5.70  | 53   | 2.08 | 5  | 0.2  |    |      |     |            |
| 2     | 205 | 8.07  | 75  | 2.95 | 150 | 5.91 | 194 | 7.63  | 55   | 2.17 | 5  | 0.2  | 0  | 0.00 | 100 | 3.93       |
| 3     | 226 | 8.90  | 90  | 3.54 | 160 | 6.30 | 215 | 8.46  | 70.7 | 2.80 | 5  | 0.2  | 0  | 0.00 | 100 | 5.95       |
| 4     | 277 | 10.91 | 115 | 4.53 | 175 | 6.89 | 265 | 10.43 | 86   | 3.40 | 6  | 0.23 |    |      |     |            |

A minimum clearance of 100 mm (3.94 in) above and below Frame 01 to 04 products is required for applications where the product is subjected to rated load and rated ambient temperature.

\* A minimum clearance of 50 mm (1.97 in) above and below Frame 01 to 04 products is permissible in applications where either the ambient operating temperature is 35 °C (95 °F) or less or the average output current is derated by 20 %.

Derating for reduced clearances is to be applied in addition to the derating for increased switching frequency if operating above 3 kHz. Refer to the Power Installation Guide for the current derating due to an increase in switching frequency.

NOTE If Din rail mounting is used in an installation, then mounting screws should be used to secure the drive to the back plate.

Table 3-1 Tools required

| Tool                         | Location                 | Size 1   | Size 2 | Size 3 | Size 4 |
|------------------------------|--------------------------|----------|--------|--------|--------|
| Small terminal screwdriver   | Control, relay terminals | ✓        | ✓      | ✓      | ✓      |
| 3 mm Flat-bladed screwdriver | Power terminals          | ✓        |        |        |        |
| 5 mm Flat-bladed screwdriver | Terminal cover           | ✓        | ✓      | ✓      | ✓      |
| 4 mm Flat-bladed screwdriver | AC power terminals       |          | ✓      |        |        |
| Philips screwdriver          | Power terminals          |          | ✓      | ✓      | ✓      |
| Torx 10 driver               | EMC & MOV screws         | <b>√</b> | ✓      | ✓      | ✓      |

| Torx 20 driver               | Fan screw                |          | ✓      | ✓      | ✓      |

Table 3-2 Recommended torque settings

| Model size | Terminal block<br>description | Torque settings      |  |  |  |
|------------|-------------------------------|----------------------|--|--|--|
|            | Control terminals             | 0.2 N m (0.15 lb ft) |  |  |  |
| All        | Relay terminals               | 0.5 N m (0.37 lb ft) |  |  |  |
|            | Ground terminals              | 1.5 N m (1.10 lb ft) |  |  |  |
| 1          | Power terminals               | 0.5 N m (0.37 lb ft) |  |  |  |
| 2, 3, 4    | 1 Ower terminals              | 1.4 N m (1.03 lb ft) |  |  |  |

Table 3-3 Tightening torque for mounting feet

| Drive size | Tightening torque                          |
|------------|--|
| 1 to 3     | 1.3 N m (1 lb ft) to 1.6 N m (1.2 lb ft)   |
| 4          | 2.5 N m (1.8 lb ft) to 2.8 N m (2.1 lb ft) |

Figure 3-1 Feature diagram (size 2 shown)

## 4 Electrical installation

An overlay of the electrical connections / terminals is included on the back page of this manual.

### 4.1 AC supply requirements

Voltage:

100 V drive: 100 V to 120 V ±10 % 200 V drive: 200 V to 240 V ±10 % 400 V drive: 380 V to 480 V ±10 %

Number of phases: 3

Maximum supply imbalance: 2 % negative phase sequence (equivalent to 3 % voltage imbalance between phases).

Frequency range: 45 to 66 Hz.

For UL compliance only, the maximum supply symmetrical fault current must be limited to 100 kA.

NOTE

On the size 2 110 V drives or when connecting single phase to a dual rated 200 V unit, the supply should be connected to L1 and L3. Also the DC bus (-) terminal on 110 V drives has no internal connection. The 110 V drives use a voltage doubler circuit on the input, therefore the default for *Motor Rated Voltage* (Pr **08**) is 230 V.

### 4.2 External braking resistor

#### Overload protection

When an external braking resistor is used, it is essential that an overload protection device is incorporated in the braking resistor circuit; as shown in the electrical diagram on the back cover.

# 4.2.1 Minimum resistance values and peak power rating for the braking resistor at 40 $^{\circ}$ C (104 $^{\circ}$ F)

Table 4-1 Braking resistor resistance and power rating (100 V)

| Model    | Minimum<br>resistance*<br>Ω | Instantaneous<br>power rating<br>kW | Continuous<br>power rating<br>kW |
|----------|-----------------------------|-------------------------------------|----------------------------------|
| 01100017 | 130                         | 1.1                                 | 0.25                             |

<sup>\*</sup> Resistor tolerance: ±10 %

### 4.3 Ground leakage

The ground leakage current depends upon whether the internal EMC filter is installed or not. The drive is supplied with the filter installed. Instructions for removing the internal EMC filter are given in section 4.5.2 *Removing the internal EMC filter* on page 20.

With internal filter installed:

#### Size 1:

- 8.1 mA\* AC at 110 V 50 Hz
- 9.5 mA\* AC at 230 V 50 Hz

#### Size 2:

- 13 mA\* AC at 110 V, 50 Hz (1 phase)
- 6.3 mA\* AC at 230 V, 50 Hz (3 phase)
- 17.5 mA\* AC at 230 V, 50 Hz (1 phase)
- 9.2 mA\* AC at 415 V, 50 Hz (3 phase)

#### Size 3:

- 17.1 mA\* AC at 230 V 50 Hz (1 phase)
- 5.9 mA\* AC at 230 V 50 Hz (3 phase)
- 5.7 mA\* AC at 415 V 50 Hz (3 phase)

#### Size 4:

- 21.3 mA\* AC at 230 V 50 Hz (1 phase)
- 9.7 mA\* AC at 230 V 50 Hz (3 phase)
- 13.3 mA\* AC at 415 V 50 Hz (3 phase)

With internal filter removed:

Size 1: < 1 mA

Size 2: 110 V: < 1.2 mA

**230 V:** < 1 mA **415 V:** < 2.3 mA

Size 3: 230 V: < 1.6 mA

**415 V**: < 1 mA

<sup>\*</sup> Proportional to the supply voltage and frequency.

#### Size 4: < 1 mA

The above leakage currents are just the leakage currents of the drive and do not take into account any leakage currents of the motor or motor cable.

When the internal filter is installed the leakage current is high. In this case a permanent fixed ground connection must be provided, or other suitable measures taken to prevent a safety hazard occurring if the connection is lost.

When the leakage current exceeds 3.5 mA, a permanent fixed ground connection must be provided using two independent conductors each with a cross-section equal to or exceeding that of the supply conductors. The drive is provided with two ground connections to facilitate this. Both ground connections are necessary to meet EN 61800-5-1: 2007

### 4.3.1 Use of residual current device (RCD)

There are three common types of ELCB / RCD:

- 1. AC detects AC fault currents
- 2. A detects AC and pulsating DC fault currents (provided the DC current reaches zero at least once every half cycle)
- 3. B detects AC, pulsating DC and smooth DC fault currents
  - Type AC should never be used with drives.
  - Type A can only be used with single phase drives
  - Type B must be used with three phase drives

Only type B ELCB / RCD are suitable for use with 3 phase inverter drives.

If an external EMC filter is used with an ELCB / RCD, a delay of at least 50 ms should be incorporated to ensure spurious trips are not seen. The leakage current is likely to exceed the trip level if all of the phases are not energized simultaneously.

# 4.4 Control terminal configurations and wiring

| 05    |       | Drive Co                                  |            |         |            |  |        |    |  |
|-------|-------|---|------------|---------|------------|--|--------|----|--|

### 4.5 EMC

#### 4.5.1 Internal EMC filter

It is recommended that the internal EMC filter be kept in place unless there is a specific reason for removing it. If the drive is used as a motoring drive as part of a regen system, then the internal EMC filter must be removed.

The internal EMC filter reduces radio-frequency emission into the line power supply.

For longer motor cables, the filter continues to provide a useful reduction in emission levels and when used with any length of shielded motor cable up to the limit for the drive, it is unlikely that nearby industrial equipment will be disturbed. It is recommended that the filter be used in all applications unless the instructions given above require it to be removed, or where the ground leakage current is unacceptable.

#### 4.5.2 Removing the internal EMC filter

The supply must be disconnected before removing the internal EMC filter.

Figure 4-11 Removal of the internal EMC filter (size 2 shown)

To electrically disconnect the internal EMC filter, remove the screw as shown above (1).

#### 4.5.3 Further EMC precautions

Further EMC precautions are required if more stringent EMC emission requirements apply:

- Operation in the first environment of EN 61800-3:2004+A1:2012.
- · Conformity to the generic emission standards
- Equipment which is sensitive to electrical interference operating nearby In this case it is necessary to use:
- · The optional external EMC filter
- A shielded motor cable, with shield clamped to the grounded metal panel
- A shielded control cable, with shield clamped to the grounded metal panel Full instructions are given in the *Power Installation Guide*.

A full range of external EMC filters are also available for use with *Unidrive M200 / M201*, shown in the *Power Installation Guide*.

# 5 Keypad and display

The keypad and display provide information to the user regarding the operating status of the drive, alarms and trip codes, and provide the means for changing parameters, stopping and starting the drive, and the ability to perform a drive reset.

- (1) The Enter button is used to enter parameter view or edit mode, or to accept a parameter edit.
- (2 / 5) The Navigation buttons can be used to select individual parameters or to edit parameter values.
- (3) The Stop / Reset button (red) is used to stop and reset the drive in keypad mode. It can also be used to reset the drive in terminal mode.
- (4) The Start button (green) is used to start the drive in keypad mode.
- (6) The Escape button is used to exit from the parameter edit / view mode.
- (7) The Speed ref potentiometer is used to control the frequency reference in keypad mode (only on Unidrive M201).

Table 5-1 Status indications

| String | Description   | Drive output stage |
|--------|---|--------------------|
| inh    | The drive is inhibited and cannot be run. The Drive Enable signal is not applied to the drive enable terminal or is set to 0.         | Disabled           |
| rdy    | The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active | Disabled           |
| StoP   | The drive is stopped / holding zero speed.  | Enabled            |
| S.Loss | Supply loss condition has been detected   | Enabled            |
| dc inj | The drive is applying dc injection braking  | Enabled            |
| Er     | The drive has tripped and no longer controlling the motor. The trip code appears on the display.                                      | Disabled           |
| UV     | The drive is in the under voltage state either in low voltage or high voltage mode.   | Disabled           |
| HEAt   | The motor pre-heat function is active   | Enabled            |

### 5.1 Saving parameters

When changing a parameter in Menu 0, the new value is saved when pressing the Enter button

to return to parameter view mode from parameter edit mode.

If parameters have been changed in the advanced menus, then the change will not be saved automatically. A save function must be carried out.

#### **Procedure**

- 1. Select 'Save' in Pr 00 or Pr mm.000 (alternatively enter a value of 1001 in Pr 00 or Pr mm.000)
- 2 Fither:
- Press the red reset button
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100

## 5.2 Restoring parameter defaults

Restoring parameter defaults by this method saves the default values in the drives memory. *User Security Status* (Pr **10**) and *User Security Code* (Pr **25**) are not affected by this procedure.

#### **Procedure**

- 1. Ensure the drive is not enabled, i.e. drive is in inhibit or under voltage state.
- Select 'Def.50' or 'Def.60' in Pr 00 or Pr mm.000 (alternatively, enter 1233 (50 Hz settings) or 1244 (60 Hz settings) in Pr 00 or Pr mm.000).
- 3. Either:
- Press the red reset button
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100

# 6 Basic parameters (Menu 0)

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive.

# 6.1 Menu 0: Basic parameters

<sup>\*\*</sup> Setting Pr 07 to 0.0 will disable slip compensation.
\*\*\* Following a rotating autotune, Pr 09 is continuously written to by the drive, calculated from the value of Stator Inductance (Pr 05.025). To manually enter a value into Pr 09, Pr 05.025 will need to be set to 0. Refer to the description of Pr 05.010 in the Parameter Reference Guide for further details.

\*\*\*\* If this parameter is read via serial communications, it will indicate pole pairs.

Set Pr 01 at the required minimum output frequency of the drive for both directions of rotation. The drive speed reference is scaled between Pr 01 and Pr 02. Pr 01 is a nominal value; slip compensation may cause the actual frequency to be higher. When the drive is jogging, Pr 01 has no effect.

|       | 02 |     | Maximu    | m Speed  |   |    |            |       |  |

Set Pr **02** at the required maximum output frequency for both directions of rotation. The drive speed reference is scaled between Pr **01** and Pr **02**. Pr **02** is a nominal value; slip compensation may cause the actual frequency to be higher. The drive has additional over-speed protection.

Set Pr **03** at the required rate of acceleration. Note that larger values produce lower acceleration. The rate applies in both directions of rotation.

| KFC-A                  |           |     |            |           |    |   |  |   |           |      |  |

Set Pr **04** at the required rate of deceleration. Note that larger values produce lower deceleration. The rate applies in both directions of rotation.

|    | 05 Drive Cor |       |  |            | on       |   |  |        |    |  |
|----|--------------|-------|--|------------|----------|---|--|--------|----|--|

| 7     | E.Pot   | Electronic Potentiometer  |
| 8     | torquE  | Torque mode, Analog input 1 (current frequency reference) or Analog input 2 |
| Ŭ     | torque  | (voltage torque reference) selected by terminal                             |
| 9     | Pid     | PID mode, Analog input 1 (current feedback source) and Analog input 2       |
|       |         | (voltage reference source)  |

#### NOTE

A change to Pr **05** is set by pressing the ENTER button on exit from parameter edit mode. The drive must be disabled, stopped or tripped for a change to take place. If Pr **05** is changed while the drive is running, when the ENTER button is pressed on exit from parameter edit mode, Pr **05** will change back to its previous value.

NOTE

When the setting of Pr **05** is changed, the appropriate drive configuration parameters are set back to their default values.

| 06 Motor Rated Current  RW Num RA US |             |          |   |                        |  |    |                        |                        |               |

The rated current parameter must be set to the maximum continuous current of the motor (taken from the name plate). The motor rated current is used in the following:

- Current limits
- Motor thermal overload protection
- Vector mode voltage control
- Slip compensation
- Dynamic V/F control

|       | 07                 |     | Motor R    | Motor Rated Speed |  |  |                          |  |  |    |  |  |
|-------|--------------------|-----|------------|-------------------|--|--|--------------------------|--|--|----|--|--|
| RV    | V                  | Num |            |                   |  |  | -                        |  |  | US |  |  |

Defines the mode of analog input 1.

The table below gives all the possible analog input modes.

| Value | Text    | Function   |
|-------|---------|--|
| -6    | 4-20.S  | Stop on loss   |
| -5    | 20-4.S  | Stop on loss   |
| -4    | 4-20.L  | 4-20 mA switching to equivalent of 4 mA input current on loss  |
| -3    | 20-4.L  | 20-4 mA switching to equivalent of 20 mA input current on loss |
| -2    | 4-20.H  | 4-20 mA hold at level before loss on loss                      |
| -1    | 20-4.H  | 20-4 mA hold at level before loss on loss                      |
| 0     | 0-20    | 0-20 mA  |
| 1     | 20-0    | 20-0 mA  |
| 2     | 4-20.tr | 4-20 mA trip on loss   |
| 3     | 20-4.tr | 20-4 mA trip on loss   |
| 4     | 4-20    | 4-20 mA no action on loss                                      |
| 5     | 20-4    | 20-4 mA no action on loss                                      |
| 6     | Volt    | Voltage  |

In 4-20 mA and 20-4 mA modes loss of input is detected if the current falls below 3 mA.

#### NOTE

If both analog inputs (A1 and A2) are to be set-up as voltage inputs, and if the potentiometers are supplied from the drive's +10 V rail (terminal T4), they must have a resistance >4 k $\Omega$  each.

| 17 Bipolar Reference Enable |    |     |           |           |  |   |  |  |         |    |  |

| OL<br>RFC-A | \$ | Fast | : (0), Std (<br>Fst.b |          | t (2), | ⇧                |  |  | Std (1) | )  |  |  |  |

Defines the mode used by the ramp system.

- 0: Fast ramp
- 1: Standard ramp
- 2: Standard ramp with motor voltage boost
- 3: Fast ramp with motor voltage boost

Fast ramp is linear deceleration at programmed rate, normally used when a braking resistor is installed.

Standard ramp is controlled deceleration to prevent DC bus over-voltage trips, normally used when there is no braking resistor installed.

If a high motor voltage mode is selected, deceleration rates can be faster for a given inertia but motor temperatures will be higher.

|       | 29 Ramp Enable |     |           |           |  |   |  |        |    |  |
|-------|----------------|-----|-----------|-----------|--|---|--|--------|----|--|
| RV    | V              | Bit |           |           |  |   |  |        | US |  |
| OL    | <b>↑</b>       |     |           |           |  | Û |  |        |    |  |
| RFC-A | ₩.             |     | Off (0) c | or On (1) |  | , |  | On (1) | )  |  |

Setting Pr 29 to 0 allows the user to disable the ramps. This is generally used when the drive is required to closely follow a speed reference which already contains acceleration and deceleration ramps.

| 30    |    |                               | Parameter Cloning  |  |  |   |  |          |  |     |  |

### Open-loop:

Set to 1 to enable Dynamic V to F mode in open-loop mode only.

- 0: Fixed linear voltage to frequency ratio (constant torque standard load)
- 1: Voltage to frequency ratio dependant on load current. This gives a higher motor efficiency.

### RFC-A:

If this parameter is set to 1, the flux is reduced so that the magnetizing current is equal to the torque producing current, to optimize copper losses and reduce iron losses in the motor under low load conditions.

| Catch a Spinning Motor |    |        |                    |  |          |   |  |         |    |  |

If the drive is to be configured in fixed boost mode (Pr 41 = Fd or SrE) with catch a spinning motor software enabled, an autotune (see Pr 38 on page 41) must be carried out to measure the motor's stator resistance beforehand. If a stator resistance is not measured, the drive may trip on OV or OI.AC while trying to catch a spinning motor.

| Pr 33 | Text    | Function                         |

| RFC-A | *  |     | 0 t     | 0 3 | , |    | · · |    |  |

Defines the auto-tune test to be performed.

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

## Open Loop and RFC-A:

- 1. A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. To perform a Stationary autotune, set Pr **38** to 1.
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first
  performs a stationary autotune, as above, then a rotating test is performed in which the motor is
  accelerated with currently selected ramps up to a frequency of *Rated Frequency* (Pr 39) x 2/3,
  and the frequency is maintained at that level for 4 seconds. To perform a Rotating autotune, set
  Pr 38 to 2.

### RFC-A only:

3. This test measures the total inertia of the load and the motor. A series of progressively larger torque levels are applied to the motor to accelerate the motor up to 3/4 x *Motor Rated Speed* (Pr **07**) to determine the inertia from the acceleration/deceleration time.

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the enable signal from terminal 11.

A rotating autotune will cause the motor to accelerate up to 2/3 base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable.

| RFC-A | *        |     | Auto (0) t            | 0 02 (10) |  | ŕ  |  |  | Auto (c | ') |  |

Set to the number of poles of the motor. The auto mode calculates the number of motor poles from the settings of Pr **07** and Pr **39**.

|       | 41       |     | Control                   | Mode |   |  |          |    |  |
|-------|----------|-----|---------------------------|------|---|--|----------|----|--|
| RV    | V        | Txt |                           |      |   |  |          | US |  |
| OL    | <b>û</b> |     | , Ur (1), F<br>(4), SrE ( |      | ⇧ |  | Ur.I (4) | )  |  |
| RFC-A | -        |     |                           |      |   |  |          |    |  |

Defines the drive output mode, which can either be a voltage mode or a current mode.

| Value | Text       | Description   |
|-------|------------|---|
| 0     | Ur.S       | Stator resistance and voltage offset measured at each start         |
| 1     | Ur         | No measurements   |
| 2     | Fd         | Fixed boost mode.   |
| 3     | Ur.Auto    | Stator resistance and voltage offset measured at first drive enable |
| 4     | Ur.I       | Stator resistance and voltage offset measured at each power-up      |
| 5     | SrE        | Square law characteristic   |
| 6     | Fd.tap (6) | Fixed boost with taper  |

NOTE

The drive default setting is Ur I mode which means that the drive will carry out an autotune every time the drive is powered-up and enabled. If the load is not going to be stationary when the drive is powered-up and enabled, then one of the other modes should be selected. Not selecting another mode could result in poor motor performance or OI.AC, It.AC or OV trips.

Defines the proportional gain for frequency controller 1.

# RFC modes only.

The controller includes a feed forward proportional gain (Kp), a feed forward integral gain (Ki), and a differential feedback gain (Kd).

### Proportional gain (Kp)

If Kp is non-zero and Ki is zero the controller will only have a proportional term, and there must be a frequency error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual frequencies.

### Integral gain (Ki)

The integral gain is provided to prevent frequency regulation. The error is accumulated over a period of time and used to produce the necessary torque reference without any frequency error. Increasing the integral gain reduces the time taken for the frequency to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor.

| OL    | ſr | 0.0 to 10.0 |          | IJ       |     | 1.0 |  |    |  |
| RFC-A |    |             | ŕ        |          | 1.0 |     |  |    |  |

Spin Start Boost (Pr **69**) is used by the algorithm that detects the frequency of a spinning motor when the drive is enabled and Catch A Spinning Motor (Pr **33**)  $\geq$  1. For smaller motors the default value of 1.0 is suitable, but for larger motors, Spin Start Boost (Pr **69**) may need to be increased.

If Spin Start Boost (Pr 69) is too small the drive will detect zero frequency, whatever the frequency of the motor, and if Spin Start Boost (Pr 69) is too large, the motor may accelerate away from standstill when the drive is enabled.

### Open loop mode:

Final Demand Reference shows the fundamental drive output frequency from the Post Ramp Reference and the Hard Frequency Reference.

#### RFC mode:

Final Demand Reference shows the reference at the input to the frequency controller, which is the sum of the Post Ramp Reference, if the ramp output is not disabled and the hard frequency reference (if enabled). If the drive is disabled Final Demand Reference shows 0.00.

This parameter displays the level of the analog signal present at analog input 2 (terminal 5).

**7** Running the motor
This section takes a new user through all the essential steps to running a motor for the first time.

Table 7-1 Open Loop and RFC-A

| Action   | Detail   |  |
|--|--|--|
| Action   |  |  |
| Before power up  | Ensure:  • The drive enable signal is not given, terminal 11 is open  • The run signal is not given, terminal 12/13 is open  • The motor is connected to the drive  • The motor connection is correct for the drive ∆ or Y  • The correct supply voltage is connected to the drive   | *  |
| Power up the drive   | The default setting is Open Loop vector mode. For RFC-A mode set Pr 79 to RFC-A, then press the stop/reset button to save the parameters.  Ensure: The drive displays: inh (enable terminal(s) is open)  | ]/<br>]/   |
| Enter minimum and maximum speeds                             | Enter:  Minimum speed Pr 01 (Hz)  Maximum speed Pr 02 (Hz)   | 0.02   |
| Enter accel and decel rates                                  | Enter:  • Acceleration rate Pr 03 (s/100 Hz)  • Deceleration rate Pr 04 (s/100 Hz)   | 10000 - 200 - 1  |
| Enter motor<br>nameplate details                             | <ul> <li>Motor rated current in Pr 06 (Amps)</li> <li>Motor rated speed in Pr 07 (rpm / min<sup>-1</sup>)</li> <li>Motor rated voltage in Pr 08 (Volts)</li> <li>Motor rated power factor in (cos φ) Pr 09</li> </ul>  | $ \begin{bmatrix} MOT. 3 & \searrow & LS 80 & L & T \\ \hline IP 55 & I & CLF & 40^{\circ}C & ST \\ \hline V & Hz & min' & LW & Cos & \phi & A \\ \hline \\ O & \Delta & 230 & 50 & 2800 & 0.75 & 0.83 & 0.3 & \frac{1}{60} \\ \hline \\ 0 & 3 & 2 & 3 & 3 & 3 & 3 \\ \hline \end{bmatrix} $ |
| Ready to autotune  |  |  |
| Autotune   | The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled.  To perform an autotune:  Set Pr 38 = 1 for a stationary autotune or set Pr 38 = 2 for a rotating autotune  Close the drive enable signal (apply +24 V to terminal 11). The drive will display 'rdy'.  Give a Run command (apply +24 V to terminal 12 - Run forward or terminal 13 - Run reverse on Unidrive M200; press keypad Start button on M201). The display will flash 'tuning' while the drive is performing the autotune.  Wait for the drive to display 'inh' and for the motor to come to a standstill.  Remove the drive enable and run signal from the drive. | COS SI   |
| Autotune complete  | When the autotune has been completed, Pr 38 will be set to 0   |  |
| Tuning of frequency<br>controller gains<br>(RFC-A mode only) | Depending on the application, the frequency controller gains (Pr 65 and Pr 66) may need to be adjusted.  |  |
| Save parameters  | ·  |  |
| Save parameters  | Select 'SAVE' in Pr <b>00</b> or Pr <b>mm.000</b> (alternatively enter a value of 1001) and press the Stop / Reset button to save parameters.  |  |

| Action                          | Detail   |   |  |  |  |  |
|---------------------------------|--|---|--|--|--|--|
| Ready to run                    | Ready to run   |   |  |  |  |  |
| Run                             | The drive is now ready to run the motor. Close the Run Forward or Run Reverse terminals on Unidrive M200; press keypad Start button on M201.   |   |  |  |  |  |
| Increasing and decreasing speed | Changing the selected Analog frequency reference (Speed Ref Potentiometer on M201) will increase and decrease the speed of the motor.  | • |  |  |  |  |
| Stopping                        | To stop the motor by following the selected deceleration rate, open either the run forward or run reverse terminal on Unidrive M200; press keypad Stop button on M201. If the enable terminal is opened while the motor is running, the drive output is immediately disabled and the motor will coast to a stop. |   |  |  |  |  |

# 8 Diagnostics

Users must not attempt to repair a drive if it is faulty, nor carry out fault diagnosis other than through the use of the diagnostic features described in this chapter. If a drive is faulty, it must be returned to the supplier of the drive for repair.

Table 8-1 Trip indications

| Trip  |  |   |
|-------|--|---|
| code  | Condition  | Description   |
| C.Acc | NV Media Card Write fail   | Unable to access the NV Media Card.   |
| C.by  | NV Media Card cannot be accessed as it is being accessed by an option module                                   | An attempt has been made to access a file on NV Media Card, but the NV Media Card is already being accessed by an option module. No data is transferred.  |
| C.cPr | NV Media Card file/data is different to the one in the drive   | A <i>C.cPr</i> trip is initiated if the parameters on the NV Media Card are different to the drive.   |
| C.d.E | NV Media Card data location already contains data  | Attempt has been made to store data on a NV Media Card in a data block which already contains data.   |
| C.dAt | NV Media Card data not found   | Attempt has been made to access non-existent file or block on the NV Media Card.  |
| C.Err | NV Media Card data structure error   | Attempt has been made to access the NV Media Card but an error has been detected in the data structure on the card. Resetting the trip will cause the drive to erase and create the correct folder structure. |
| C.FuL | NV Media Card full   | There is not enough space left on the card.   |
| C.OPt | NV Media Card trip; option<br>modules installed are different<br>between source drive and<br>destination drive | The parameter data or default difference data is being transferred from the NV Media Card to the drive, but the option module category is different between the source and destination drives.                |
| C.Pr  | NV Media Card data blocks are not compatible with the drive derivative   | If Drive Derivative is different between the source and target drives. Refer to the Control User Guide.   |
| C.rdo | NV Media Card has the Read Only bit set  | Attempt has been made to modify a read-only NV Media Card or a read-only data block.  |
| C.rtg | NV Media Card Trip; The voltage and / or current rating of the source and destination drives are different     | The current and / or voltage ratings are different between source and destination drives.   |
| C.SL  | NV Media Card trip; Option module file transfer has failed   | The C.SL trip is initiated, if the transfer of an option module file to or from a module failed because the option module does not respond correctly.   |
| C.tyP | NV Media Card parameter set not compatible with current drive mode   | The drive mode in the data block on the NV Media Card is different from the current drive mode.   |

| Trip<br>code | Condition  |   | Description   |  |  |
|--------------|--|---|---|--|--|
| cL.A1        | Analog input 1 current loss  | Current loss was dete<br>(Terminal 2).  | ected in current mode on Analog input 1   |  |  |
| CL.bt        | Trip initiated from the Control Word                                 | Initiated by setting bit 12 on the control word when the control word is enabled. Refer to the <i>Parameter Reference Guide</i> |   |  |  |
| Cur.c        | Current calibration range  | Current calibration range error.  |   |  |  |
| Cur.O        | Current feedback offset error  | Current offset is too large to be trimmed.  |   |  |  |
| d.Ch         | Drive parameters are being changed                                   | A user action or a file system write is active that is changing the drive parameters and the drive has been commanded to enable |   |  |  |
| dEr.E        | Derivative file error  | Contact the supplier of   | of the drive.   |  |  |
| dEr.l        | Derivative product image error                                       | Contact the supplier of   | of the drive  |  |  |
| dESt         | Two or more parameters are writing to the same destination parameter |   | s that destination output parameters of two<br>s within the drive are writing to the same   |  |  |

| UP.uS        | User Program trip   | This trip can be initiat Refer to the Control U  | ed from within an onboard user program.  Jser Guide.   |  |  |  |
| UPrG         | User Program  | An error has been de Refer to the Control U  | tected in the onboard user program image.  Jser Guide.   |  |  |  |

# 8.1 Alarm indications

In any mode, an alarm is an indication given on the display by alternating the alarm string with the drive status string display. If an action is not taken to eliminate any alarm except "tuning", the drive may eventually trip. Alarms are not displayed when a parameter is being edited.

Table 8-2 Alarm indications

| Alarm string | Description   |
|--------------|---|
| br.res       | Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> in the drive has reached 75.0 % of the value at which the drive will trip.Refer to the <b>Power Installation Guide</b> .                   |
| OV.Ld        | Motor Protection Accumulator in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %, reduce motor current (load). Refer to the Parameter Reference Guide |
| d.OV.Ld      | Drive over temperature. Percentage Of Drive Thermal Trip Level in the drive is greater than 90 %. Refer to the Parameter Reference Guide  |
| tuning       | The autotune procedure has been initialized and an autotune in progress.  |
| LS           | Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped  |
| Lo.AC        | Low voltage mode. See Low AC Alarm in the Control User Guide  |
| I.AC.Lt      | Current limit active. See Current Limit Active in the Control User Guide  |
| 24.LoSt      | 24V backup not present. See 24V Alarm Loss Enable in the Control User Guide   |

# 9 NV Media Card Operation Figure 9-1 Installing the AI-Backup adaptor (SD Card)

- 1. Identify the two plastic fingers on the underside of the Al-Backup Adaptor (1) then insert the two fingers into the corresponding slots in the spring-loaded sliding cover on the top of the drive.
- 2. Hold the adaptor firmly and push the spring loaded protective cover towards the back of the drive to expose the connector block (2) below.

Press the adaptor downwards (3) until the adaptor connector locates into the drive connection below.

Figure 9-2 Basic NV Media Card operation

The whole card may be protected from writing or erasing by setting the read-only flag, refer to the *Control User Guide* for further information. The card should not be removed during data transfer, as the drive will produce a trip. If this occurs then either the transfer should be re-attempted or in the case of a card to drive transfer, default parameters should be loaded.

#### NOTE

The drive supports SD cards formatted with the FAT32 file system only.

# 10 Machine Control Studio

Machine Control Studio programming software powered by CODESYS

Machine Control Studio software provides a flexible and intuitive environment for programming Unidrive M's new automation and motion control features. This new software offers programming for the Unidrive M200's onboard PLC (not available on Unidrive M201).

Machine Control Studio is powered by CODESYS, the leading open software for programmable machine control. The programming environment is fully EN/IEC 61131-3 compliant, meaning that it is familiar and therefore fast and easy to use for control engineers around the world.

The following EN/IEC 61131-3 programming languages are supported:

- Structured Text (ST)
- Function Block Diagram (FBD)
- Structured Function Chart (SFC)
- Ladder Diagram (LD)
- Instruction List (IL)

### Also supported:

Continuous Function Chart (CFC)

#### Onboard intelligence

- Programmable Logic Control (PLC) memory: 12 kB
- 1 x Real-time task (16 ms), 1 x Background task

Intuitive IntelliSense functionality helps to write consistent and robust programming, speeding up software development. Programmers have access to a vibrant open-source community for function blocks. Machine Control Studio supports customers' own function block libraries, with on-line monitoring of program variables with user defined watch windows and help for on-line change of program, in line with current PLC practices.

Download Machine Control Studio from: www.drive-setup.com.

# 11 UL listing information

# 11.1 UL file reference

All models are UL Listed to both Canadian and US requirements. The UL file reference is: NMMS/ 7 F171230

# 11.2 Option modules, kits and accessories

Option Modules, Control Pods, Installation Kits and other accessories for use with these drives are UL Listed.

# 11.3 Enclosure ratings

All models are Open Type as supplied.

The drive enclosure is not classified as a fire enclosure. A separate fire enclosure must be provided. A UL/ NEMA Type 12 enclosure is suitable.

When fitted with a conduit box the drives meet the requirements for UL Type 1. Type 1 enclosures are intended for indoor use, primarily to provide a degree of protection against limited amounts of falling dirt.

Remote Keypads are UL Type 12 when installed with the sealing washer and fixing kit provided. When installed in a Type 1 or Type 12 enclosure, the drives may be operated in a compartment handling conditioned air.

# 11.4 Mounting

Drives may be surface mounted using the appropriate brackets. Drives may be mounted singly or side by side with suitable space between them (bookcase mounting).

# 11.5 Environment

Drives must be installed in a Pollution Degree 2 environment or better (dry, non-conductive pollution only)

The drives have been evaluated for use at ambient temperatures up to 40 °C. The drives have additionally been evaluated for 50 °C and 55 °C ambient air temperatures with a derated output.

# 11.6 Electrical Installation

#### OVERVOLTAGE CATEGORY

OVC III

### **SUPPLY**

The drives are suitable for use on a circuit capable of delivering not more than 100,000 RMS symmetrical amperes, 600 Volts AC Maximum.

#### **TERMINAL TORQUE**

Terminals must be tightened to the rated torque as specified in the Installation Instructions.

# **WIRING TERMINALS**

Drives must be installed using cables rated for 75 °C operation, copper wire only.

Where possible, UL Listed closed-loop connectors sized according to the field wiring shall be used for all field power wiring connections.

### **GROUND CONNECTION INSTRUCTIONS**

UL Listed closed-loop connectors sized according to the field wiring shall be used for grounding connections.

#### **BRANCH CIRCUIT PROTECTION**

The fuses and circuit breakers required for branch circuit protection are specified in the Installation Instructions.

### **OPENING OF BRANCH CIRCUIT**

Opening of the branch-circuit protective device may be an indication that a fault has been interrupted. To reduce the risk of fire or electric shock, the equipment should be examined and replaced if damaged. If burnout of the current element of an overload relay occurs, the complete overload relay must be replaced.

Integral solid state short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the National Electrical Code (NEC), The Canadian Electrical Code, and any additional local codes.

#### DYNAMIC BRAKING

M100, M101, M200, M201, M300 or M400, frame sizes 1 to 4 have been evaluated for dynamic braking applications. Other drive models have not been evaluated for dynamic braking.

# 11.7 Motor overload protection and thermal memory retention

All drives incorporate internal overload protection for the motor load that does not require the use of an external or remote overload protection device.

The protection level is adjustable and the method of adjustment is provided in the *Control User Guide*. Maximum current overload is dependent on the values entered into the current limit parameters (motoring current limit, regenerative current limit and symmetrical current limit entered as percentage) and the motor rated current parameter (entered in amperes).

The duration of the overload is dependent on motor thermal time constant. The maximum programmable time constant depends on the drive model. The method of adjustment of the overload protection is provided.

The drives are provided with user terminals that can be connected to a motor thermistor to protect the motor from high temperature, in the event of a motor cooling fan failure.

# 11.8 External Class 2 supply

The external power supply used to power the 24 V control circuit shall be marked: "UL Class 2". The power supply voltage shall not exceed 24 Vdc.

On the size 2 110 V drives or when connecting single phase to a dual rated 200 V unit, the supply should be connected to L1 and L3.

- \* Not required on Unidrive M201 since the Speed ref potentiometer is already on the product. The Run/Stop commands are given from the keypad and if reverse direction is needed, the user should set Pr 17 to On.
- \*\* 250 Vac maximum (UL class 1).
